1.	<p>Design a class BankAccount that represents a bank account using encapsulation. The class should include: A private attribute <code>_balance</code> to store the account balance.</p> <p>A static variable <code>total_accounts</code> to keep track of the total number of bank accounts created.</p> <p>Methods:</p> <ul style="list-style-type: none"><li>a. <code>__init__(self, initial_balance=0)</code>: Initializes the account with a starting balance and updates the static variable <code>total_accounts</code>. Ensure the initial balance is non-negative.</li><li>b. <code>set_balance(self, new_balance)</code>: Allows modifying the balance, but ensures the balance cannot be set to a negative value.</li><li>c. <code>deposit(self, amount)</code>: Adds the specified amount to the balance. Ensure the amount is positive.</li><li>d. <code>withdraw(self, amount)</code>: Withdraws the specified amount from the balance.</li></ul>	20
